Developing Entrepreneurial Thinking in Engineering Students by Utilizing Integrated Online Modules

Dr. Ronald S Harichandran P.E., University of New Haven

Ron Harichandran is Dean of the Tagliatela College of Engineering and is the PI of the grant entitled Developing Entrepreneurial Thinking in Engineering Students by Utilizing Integrated Online Modules and a Leadership Cohort. Through this grant entrepreneurial thinking will be integrated into courses spanning all four years in seven ABET accredited engineering and computer science BS programs.

Dr. Maria-Isabel Carnasciali, University of New Haven

Maria-Isabel Carnasciali is an Assistant Professor of Mechanical Engineering at the Tagliatela College of Engineering, University of New Haven, CT. She obtained her Ph.D. in Mechanical Engineering from Georgia Tech in 2008. She received her Bachelors of Engineering from MIT in 2000. Her research focuses on the nontraditional engineering student – understanding their motivations, identity development, and impact of prior engineering-related experiences. Her work dwells into learning in informal settings such as summer camps, military experiences, and extra-curricular activities. Other research interests involve validation of CFD models for aerospace applications as well as optimizing efficiency of thermal-fluid systems.

Dr. Nadiye O. Erdil, University of New Haven

Nadiye O. Erdil is an assistant professor of industrial engineering and engineering and operations management at the University of New Haven. Her research interests include use of statistical methods and lean tools for quality and process improvement, and use of information technology in operations management. Her work is primarily in manufacturing and healthcare delivery operations.

Dr. Cheryl Q Li, University of New Haven

Dr. Jean Nocito-Gobel, University of New Haven

Jean Nocito-Gobel, Professor of Civil & Environmental Engineering at the University of New Haven, received her Ph.D. from the University of Massachusetts, Amherst. She has been actively involved in a number of educational initiatives in the Tagliatela College of Engineering including KEEN and PITCH, and is the coordinator for the first-year Intro to Engineering course. Her professional interests include modeling the transport and fate of contaminants in groundwater and surface water systems, as well as engineering education reform.

Dr. Samuel D. Daniels P.E., University of New Haven

Developing Entrepreneurial Thinking in Engineering Students by Utilizing Integrated Online Modules

Abstract

An approach to develop entrepreneurial thinking skills in engineering students by integrating online modules into existing courses is described. Eighteen online modules covering a variety of topics will be developed. Developers for the modules are selected by reviewing proposals submitted in response to a broadly distributed request for proposals. Developers undergo extensive training before embarking upon module development. Students will complete each standalone module outside of class hours. Instructors who deploy a module in their course will develop contextual course assignments that reinforce concepts covered in the modules. These instructors also undergo training and are assisted by an external consultant. All engineering students will complete at least 13 of the 18 modules; some will complete all 18 modules.

Introduction

Engineering graduates who will be leaders in today's rapidly changing environment must possess an entrepreneurial mindset and a variety of professional skills in addition to technical knowledge and skills. Efforts at developing technical communication, project management, and teamwork skills have been underway at many institutions over the last decade. A newer initiative is the development of entrepreneurial thinking skills.¹⁻³ At its core, entrepreneurial thinking requires: (1) insatiable curiosity to investigate a rapidly changing world; (2) the ability to innovate by make connections between different streams of information; and (3) to create value for others. Entrepreneurial thinking results in the development of a sound technical solution that addresses customer needs, is feasible from a business perspective, and has societal benefit.

It is difficult to develop the many professional skills needed by today's graduates within the framework of engineering programs that are crowded by technical requirements. A creative approach is to utilize online learning modules. There are several advantages to the online learning modules over the development of more traditional classroom content:

- A large number of students, ideally all engineering students, can be required to complete the modules thereby having broad impact
- The modules can be easily shared with other institutions for deployment
- The modules can be integrated into regular courses or serve as supplementary resources
- A "flipped class" instructional model can be used where classroom time is spent on practical applications and content is delivered outside of class time
- Students can learn the content asynchronously and fit the learning around their own schedules

Learning Modules and Target Courses for Integration

There are several concepts that students must learn in order to be entrepreneurially minded. To enable all engineering students in the Tagliatela College of Engineering (TCoE) at the University of New Haven (UNH) to learn these concepts, 18 interactive online learning modules will be developed and integrated into courses spanning all four years across all engineering and computer science disciplines. The titles of the online learning modules and the courses into

Table 1: Online learning modules and target courses into which they will be integrated

Online Learning Modules	Target Courses for Integration of Modules
1. Generating new ideas based on societal needs and business opportunities	Introduction to Engineering
2. Developing customer awareness and quickly testing concepts through customer engagement*	
3. Thinking creatively to drive innovation	Project Planning and Development
4. Learning from failure*	
5. Establishing the cost of production or delivery of a service, including scaling strategies*	Project Management and Engineering Economics
6. Determining market risks*	Applied Engineering Statistics
7. Designing innovatively under constraints	Transport Operations II Mechanics and Structures Lab Software Project Analysis and Design Junior Design Laboratory Fundamentals of Mechanical Design System Engineering Concepts and Design
8. Financing a business*	Business Fundamentals for Engineers (to be developed)
9. Developing a business plan that addresses stakeholder interests, economics, market potential and regulatory issues	
10. Marketing a product or service	
11. Adapting a business to a changing climate	
12. Delivering an elevator pitch	
13. Resolving difficult ethical issues	Professional Engineering Seminar Social & Professional Issues in Computing Professional and Ethical Practice
14. Building, sustaining and leading effective teams and establishing performance goals*	Chemical Engineering Laboratory Soil Mechanics Laboratory Junior Design Laboratory Thermo/Fluids Laboratory System Engineering Design Process
15. Building relationships with corporations and communities	Mandatory internships
16. Applying systems thinking to complex problems*	Disciplinary Senior Design Courses
17. Recruiting and servicing clients	
18. Defining and protecting intellectual property	

*Modules developed in Fall 2014

which they will be integrated are specified in Table 1. Modules 1-6 will be integrated into core courses that are common to many disciplines. Modules 8-12 will be integrated into a new Business Fundamentals for Engineers course that will be developed. Modules 7 and 13-18 will be integrated into junior/senior courses specific to each discipline. Seven modules (2, 4-6, 8, 14 and 16) were developed in Fall 2014. The remaining modules will be developed in stages over the next two years. Five of the seven modules developed so far are being deployed in Spring 2015, and additional modules will be deployed progressively. All modules will be fully deployed by Spring 2017.

Students in all engineering majors will complete 13 of the online modules through required courses. Only students who take the elective Business Fundamentals for Engineers course will complete modules 8-12. Each module will take 5-9 hours to complete. The modules are designed to standalone and do not have any particular prerequisite structure.

Development and Deployment of Modules and Faculty Training

Requests for proposals are issued to faculty at UNH, those at other institutions and industry consultants who have relationships with the TCoE for the development of the online learning modules. Potential developers submit their proposals using a concise form. The authors and a program director of the granting agency review the proposals received to select a developer for each module. The developers are required to undergo formal training on how to design and construct online learning modules that are highly interactive and of high quality. The Office of eLearning at UNH provides the necessary training through a 3-week online course to both UNH faculty and to faculty at other institutions. The modules are designed for course instructors to deploy in an asynchronous mode. Exercises and assessment of student learning are included in each online module. The online modules will be integrated into the courses identified in Table 1 and students will be required to complete them as part of each course. The modules do increase the workload for students, but because they are completed outside of class times, the time available for instructors to cover technical content is not reduced.

Faculty deploying the online modules into courses are charged with developing contextual material in their courses that relate to the concepts covered in the modules so as to further deepen student learning. However, faculty need help in order to do this effectively and consistently across the many courses listed in Table 1, especially because many of them are not content experts, and hence an entrepreneurially oriented consultant assists faculty. The tasks of the consultant include:

- Developing detailed learning outcomes for each of the online modules
- Helping faculty develop the contextual material in each of the target courses
- Playing a leading role in summer faculty development workshops
- Working closely with the authors with evidence collection and assessment

One-day training workshops are held each year for faculty who deploy online modules in their courses. During these workshops faculty:

1. Learn about the entrepreneurial mindset through a videoconference presentation made by a program director from the funding agency.
2. Engage in an entrepreneurially minded learning activity conducted by the authors.
3. Receive instruction from the Office of eLearning on how to use the online modules effectively within their course.
4. Learn from the Office of eLearning on how to access the online modules from within their course Blackboard sites and how to obtain the assessment results from the modules for inclusion in their course grades.
5. Receive instruction from the Office of eLearning on how to manage discussions related to the open-ended question included within each online module.
6. Be introduced via videoconference to the consultant who will visit campus to help them develop the contextual class exercises or projects.

Faculty participation in the workshop will be staggered with those who will be engaged during the first year being trained first, and more and more faculty teaching courses that deploy the online learning modules being trained in later years.

Module Architecture, Format and Instructor Resources

The online modules are developed using Trivantis's Lectora platform.⁴ The developed modules are integrated into the Blackboard Learning Management System (LMS) used at UNH. Modules are also converted to SCORM (Sharable Content Object Reference Model)⁵ objects that may be downloaded and integrated to any other LMS system.

Each online module is designed to be independent and stand-alone, although to be most effective it should be integrated into a course or activity that can provide meaningful engineering contexts. Each module will take 5-9 hours to complete, depending on the content and the learning speed of the student and contains readings, short videos and interactive self-assessment exercises. A test that can be taken only once by each student is included at the end of each module and the test score will be included in assigning the student's grade for the course that includes the module.

An Instructor's Guide is available for each module. This guide provides integration strategies, the learning outcomes, a suggested open-ended class discussion question, and either questions that can be embedded into the final examination for the course or activities that can be included within a course project. Additional reading resources and links to relevant videos are also provided.

The open-ended discussion can be conducted in class, online or a combination of both. In the discussion question shown in Appendix A for the *Cost of Production* module, the instructor poses an open-ended problem with a clearly stated learning objective. Students are required to respond with an initial post that outlines their planning solution in response to the problem posted. Each student will review the initial responses from peers and reflect on their solution to the problem. Finally, everyone must respond to the posts and comment on at least two other posts in the follow-up discussion. Students are requested to follow netiquette protocol and extend an observation or comment on an insight they did not consider.

Description of Select Modules

The online modules target courses that span from freshman to senior year of engineering programs. One module at each level is described below.

Developing Customer Awareness and Quickly Testing Concepts through Customer Engagement

The module *Developing Customer Awareness and Quickly Testing Concepts through Customer Engagement* provides students with an overview of methods used for bringing innovation to market rapidly through customer engagement. This module will help students develop skills in investigating a market, and testing concepts quickly via customer engagement.

The module consists of three lessons followed by a summary assessment of the entire module. Lesson 1 explores how innovation is brought to market rapidly and effectively through a reproducible process centered upon the customer. Students are introduced to successive refinement using analogies of evolution and USAF Colonel John Boyd's OODA loop (Observe, Orient, Decide, Act). The bilateral nature of customer engagement is first considered in Lesson 2, before examining customer awareness methods including case studies drawn from classical marketing, customer satisfaction measurement techniques, customer advisory boards

and web-based and social media driven mechanisms. Lesson 3 then surveys rapid concept testing by way of customer engagement beginning with a brief overview of classical product marketing driven R&D followed by modern rapid prototyping, Agile Development, and the Maker movement.

Each lesson engages the student using a combination of videos, stories, and case studies. Through thought-provoking articles and relevant case studies, students are challenged to reflect on how technology is changing customer engagement such as the case study describing Volkswagen's social media campaign on Building the People's Car in China. Students have the option to either listen or read the mini-lectures embedded throughout the lessons.

Concepts learned in the module pertaining to customer awareness and engagement is reinforced in each lesson using a series of 2-3 multiple-choice questions often following readings or mini-lectures. The summary assessment consists of both factual questions and questions that require students to reflect and draw conclusions from what they learned. Illustrated in Figures 1 and 2 are the factual and higher order questions pertaining to the impact of cell phones on customer engagement.

Upon completing the module, students will be able to:

- Compare the process of testing concepts through customer engagement driven by customer awareness to examples of successful successive refinement including evolution of species and USAF Colonel John Boyd's OODA loop;
- Analyze a proposed customer awareness technique relative to a stated product/service and market environment;

Developing Customer Awareness & Quickly Testing Concepts Through Customer Engagement - A Lyrical Approach

Question 7

The number of active cell phone accounts around the world

- ☐ Is actually diminishing
- ☐ Is expected to exceed world population by the year 2025
- ☐ Already rivals world population
- ☐ Is static, although the percentage of smart phone users is increasing

Figure 1. Factual question on cell phones

Developing Customer Awareness & Quickly Testing Concepts Through Customer Engagement - A Lyrical Approach

Question 8

Today, the number of active cell phone accounts rivals global population and the majority of internet usage worldwide occurs on mobile devices. This surely creates opportunity for bilateral engagement between customer and vendor. Argue for the greatest attendant risk of this mind-boggling connectivity.

- ☐ In the idiom of evolution, we are in a phase of unbalanced equilibrium in which the evolution of products and services, demand generation, sales and fulfillment is extremely rapid, creating unprecedented competitive pressures.
- ☐ With so many prospective, past and current customers interconnected, slight missteps in product fitness, product quality or service levels can be catastrophic.
- ☐ Profits are necessarily reduced as companies must spend more to communicate with customers in more diverse ways.
- ☐ Privacy issues will invite government regulation which will disproportionately advantage large companies with lobbying and legal resources not available to small and medium size enterprises.

Figure 2. Reflective/higher order question pertaining to cell phones

- Make inferences drawn from a published article about the Maker movement on the democratization of innovation.

The module *Developing Customer Awareness and Quickly Testing Concepts through Customer Engagement* is being piloted in a section of the *EASC 1107: Introduction to Engineering* course during the spring 2015 semester. Students will be assigned the module two weeks prior to introducing the final team project. The instructor will facilitate discussion between the students as they are completing the module by posting a discussion question pertaining to customer engagement. Students will be required to respond with an initial post first, before reviewing and commenting on at least two of their peers' responses. Customer engagement methods will be incorporated in the final team project.

Cost of Production

The online module entitled *Cost of Production* focuses on establishing the cost of production or delivery of services including scaling strategies. This module introduces students to concepts of production costs, market structures and internet markets. Using this interactive learning module, the students examine three real-life bicycle companies operating in a competitive market place (see Figure 3). Each company has a unique strategy: a different approach designing, differentiating, building and supplying bicycles to their target markets. At the end of the module, the students are asked to play the role of a bicycle designer and compete against one or more of the companies they learn about in the module.

After completing the online modules, using the production and marketing strategies of the three different bicycle companies as examples, students will be able to:

- Recognize how design impacts costs of products;
- Examine volume constraint and perform what if analysis for scaling up volume; and
- Appraise the decision to add labor or capital.

Figure 3. *Cost of Production* – Module content

This module will help students develop skills in identifying an opportunity, investigating the market, creating a preliminary business model, and evaluating technical feasibility, customer value, societal benefits, and economic viability. These skills are critical for the development of an entrepreneurial mindset. The overarching learning outcomes targeting entrepreneurial thinking in the *Cost of production* module are to: (1) evaluate technical feasibility and economic drivers; (2) examine societal and individual needs; (3) convey engineering solutions in economic terms; and (4) identify personal passions and a plan for professional development.

The material is delivered through a combination of text, video, and graphics, and is presented in an engaging, interactive format. Figure 4 shows a sample module page. The module also contains self-assessment exercises as well as a graded final project presented at the end. Samples of these assessment activities are shown in Figures 5 and 6.

Lesson 2: Market Structures

Notes:

[Click here to see the written highlights of this video.](#) You may want to do this so you can print this and refer to it later as we review the case studies.

On the next few screens, we will see how monopoly and oligopoly compare to a competitive market.

Figure 4. *Cost of Production* – Sample page

Lesson 1: Meet the Bike Designers: Steve Herzfeld - Velo-Zephyr

What kind of people do you think would buy the bikes Steven makes?

- ☐ Racers
- ☐ People who want a high performance bike
- ☐ College students
- ☐ People who want an inexpensive bike

Figure 5. *Cost of Production* – Multiple choice question

Lesson 1: Meet the Bike Designers: Zach Schau - Pure Fix

From what you have learned so far, do you think Pure Fix might has a sustainable model to grow their business? Why?

Figure 6. *Cost of Production* – Reflection question

Multiple-choice self-assessment questions have built in feedback, which allow students to evaluate their understanding of the material. Short reflection questions allow students to self-assess their ability to communicate what they learned. The final challenge is a mini project, which allows students to demonstrate their knowledge by constructing cost model(s) using material learned in the module.

The *Cost of Production* module will be deployed in the second year engineering course *Project Management and Engineering Economics* through multiple channels. The existing class project will be modified to align with concepts covered in the module. An online discussion forum will be used as a group exercise, which will provide students a platform to express their understanding and share reflections and thoughts on the content of the module. Furthermore, follow-up in-class discussions will be conducted to reinforce students' understanding of key concepts.

Building, Sustaining and leading Effective Teams and Establishing Performance Goals

The *Building, Sustaining and leading Effective Teams and Establishing Performance Goals* module provides students with the necessary guidance to assess team dynamics and performance. After completing the module, students will have a better understanding of their role in an effective team, be prepared to evaluate their role in promoting team goals and be able to establish performance measures both individually and for the team.

Three lessons are included in the module to help students build an effective understanding of teams: *Functioning of Teams, Individual Perceptions, and Team Performance*. Lessons include a well-structured set of text, audio and video guidance on the lesson topics, with a brief focused content that supports the lessons with authoritative references to articles or external websites. Each lesson has brief quizzes and reflection questions designed to reinforce critical content while the end-of-module assessment tool provides good overall feedback on student understanding of the lessons. Students can navigate the lessons easily with a simple menu system

to reinforce topics that might require additional review based on the assessment feedback and retake the assessment to improve their scores. An estimated 9 hours is needed for a student to successfully complete this module.

The first lesson, *Functions of Teams*, starts with key articles on “The Critical Role of Teams” by Ken Blanchard⁶ and “Work Groups and Teams in Organizations” by Kozlowski and Bell⁷ followed by reflections and brief assessment questions that reinforce content. Tuckman’s four stages of team development: *Forming, Storming, Norming, and Performing*,⁸ follow taking the student through the different stages of team development with video and interactive graphics, keeping the presentation both interactive and interesting. An example of an interactive exercise from the lesson is shown in Figure 7. The role of *consensus and compromise* round out the lesson with a set of personal reflection questions and brief interactive scenarios to help personalize the understanding of consensus and compromise as well as tips for finding consensus. Ten self-assessment questions that provide immediate feedback wrap up the lesson, reinforcing understanding more than memorization of the lesson content delivered.

The second lesson, *Individual Perceptions*, gives the student a chance to examine their own personality type and individual preferences so they can better understand the factors that influence actions and decision making in a team. The lesson also links back to the first lesson with a piece on reaching consensus based on different viewpoints. The Myers Briggs Type Indicator[®] (MBTI)⁹ is used to establish the sixteen different personality types shown in Figure 8 using a video presentation of the four key facets of personality and links to authoritative references from Truity Psychometrics LLC and Neris Analytics Limited to help explain these types and how they might best interact in a team setting. Given the often surprising results from these MBTI tests, the lesson wisely focuses on the value and importance of the student to team performance encouraging students to reflect at length on the personality test. Given the varied personality types, the addition of a section on the Objective, Reflective, Interpretive, Decisional (ORID) process for reaching consensus is well placed as the final element in the lesson.

The third and final lesson of the module is *Team Performance*. Bringing focus to well-known effective teams and introducing standard team performance tools such as team charters and performance plans, the lesson wraps up the team-based module with the crucial questions of how best to measure team performance. A sample six-element team performance plan—mission,

Figure 7. Example of modules interaction from Lesson 1

Building, Sustaining & Leading Effective Teams

Lesson 2: Individual Perceptions

Now that you know a little more about yourself, let's see how this might help you to work in a team situation. One thing that is often helpful is for each person in the group to share his or her personality type. If you know where another person is coming from, it is often easier to communicate with him or her, which leads to more effective team interaction. This chart shows a summary of the various personality types. Take a look and see how other people may have scored on their personality tests. You may want to print this to answer the questions on the following screens.

INTJ Imaginative and strategic thinkers, with a plan for everything	INTP Innovative inventors with an unquenchable thirst for knowledge	ENTJ Bold, imaginative and strong willed leaders, always finding a way or making one.	ENTP Smart and curious thinkers who cannot resist an intellectual challenge
INFJ Quiet and mystical, yet very inspiring and tireless idealists	INFP Poetic, kind and altruistic people, always eager to help a good cause	ENFJ Charismatic and inspiring leaders, able to mesmerize their listeners	ENFP Enthusiastic, creative and sociable free spirits who can always find a reason to smile.
ISTJ Practical and fact minded, individuals whose reliability cannot be doubted.	ISFJ Very dedicated and warm protectors, always ready to defend their loved ones.	ESTJ Excellent administrators, unsurpassed at managing things - or people.	ESFJ Extraordinarily caring, social and popular people, always eager to help.
ISTP Bold and practical experimenters, masters of all kinds of tools.	ISFP Flexible and charming artists, always ready to explore and experience something new.	ESTP Smart, energetic and very perceptive people, who truly enjoy living on the edge.	ESFP Spontaneous, energetic and enthusiastic entertainers - life is never boring around them

Click on the table above to see it in a larger format.

Figure 8. Lesson 2 module listing 16 Myers-Briggs personality types

team dynamics, project planning, execution, assessment, performance review—is presented as an example with brief reflection questions and quizzes to help student understanding of each portion of the six steps in the sample performance plan. A ten-question quiz on the lesson provides a final check of student mastery of the essential concepts. While briefer than the other two lessons, the intent is that students taking this module are taking a class (or classes) that require a substantial team project activity and to help focus the student's thoughts and attention on the how best to implement a team performance plan for that impending team project.

After completing the three lessons in the module: *Building, Sustaining & Leading Effective Teams*, students should be able to:

- Recognize the team life-cycle model, identify success factors at each stage of the team development process that influence productivity, and differentiate between consensus and compromise;
- Examine individual preferences found in a personality comparison instrument, identify factors that influence actions and decision making tied to that personality, and recognize the four different viewpoints used to reach consensus; and
- Relate the importance of both team and individual performance to overall team objectives and design a six-step performance plan.

This module is being piloted in the junior level laboratory courses in mechanical and civil engineering in the spring 2015 semester. The two laboratory courses, *Mechanics Laboratory* and *Structures Laboratory* have a well-established interdisciplinary team project activity that helps to address ABET EAC General Criteria 3. (d) an ability to function on multidisciplinary teams. Experience with the joint ME/CE design teams has shown the difficulty in effectively meshing student teams even with closely related disciplines. The junior level courses provide an early intervention to help prepare students for the industry-based full year senior design capstone projects but with less at stake compared to the senior design courses.

The pilot classes will complete the *Building, Sustaining & Leading Effective Teams* module prior to the start of the major design experience and formation of multidisciplinary teams. Faculty will establish online and in-class forums to discuss the completed module and then have students implement a six-step team performance plan for the combined ME/CE design project. The performance plan with individual and team assessment features will be a portion of their team project grade for the class and hopefully provide some necessary and essential feedback on building, sustaining and leading effective teams.

Applying Systems Thinking to Solve Complex Problems

The problems encountered in engineering practice are often ill defined and highly complex. The module *Applying Systems Thinking to Solve Complex Problems* is designed to assist students in tackling such problems. The module demonstrates how to simplify problems by using common tools such as function mapping, decomposition and heuristic rules.

The module is broken down into five lessons. To ensure a basic understanding of the terminology independent of the user's background, the module starts off with a set of interactive pre-assessment questions, one of which is shown in Figure 9, followed by Lessons 1 and 2 that discuss the various foundational concepts and key principles addressed in the pre-assessment. Four approaches for architecture development are provided in Lesson 3, while Lesson 4 goes in depth into heuristic descriptions of a system (see Figure 10). The concepts of verification and validation, that are key to the system engineering process, are presented in Lesson 5.

The module engages students by having them watch short videos, respond to open ended questions and reflections, and use examples grounded on experience (e.g., a bicycle) in order to clarify difficult concepts such as the systems engineering "V". Self-assessment exercises are scattered throughout the module and provide an opportunity to emphasize concepts and correct misconceptions.

The module concludes by having the user (student) apply the concepts to address a simplified complex problem, that is, to role play being on a team that has been hired to design a system that helps study the effects of climate change by studying the tops of trees.

Pre-assessment

2. Click on the column on the left and then click on the column on the right to match each of the following terms to the best option for its definition:

System	A shared boundary between parts of a system
Systems engineering	Any system can be thought of as having subsystems, and as being part of a larger system
Systems architecting	The process of executing a system's architecture
Interface	The mapping of function to form via concept
System of systems principle	An organized set of parts/components that operate together to provide some useful function

Figure 9. *Applying Systems Thinking* – A pre-assessment question

Figure 10. *Applying Systems Thinking – View of systems*

Upon completion of the modules, students will be able to:

- Define a system, systems architecture, and system engineering
- Decompose a system hierarchy to at least four levels
- Define any system from various perspectives, including technical feasibility, value, risk, and societal impact
- Describe four methods of developing a system architecture
- Apply the heuristic architecting method to develop a system architecture
- Develop a functional decomposition for a system using the material/signal/energy approach
- Apply the systems engineering “V” to implement a complex system

In Fall 2015 the *Applying Systems Thinking to Solve Complex Problems* module will be deployed in senior design courses within all engineering disciplines. Students will be asked to reflect how systems thinking could impact the work they are carrying out and asked to place their work in context of the system engineering process.

Assessment

Three types of assessment, knowledge acquisition, behavior/mindset growth, and solicitation of student feedback on the effectiveness and relevance of the modules will be conducted to evaluate the success of deploying the online modules in engineering courses.

Assessment of knowledge acquisition related to entrepreneurial thinking will be based on student performance in: (1) the multiple-choice test built into each online module; (2) a class assignment designed to reinforce concepts learned in the module; and (3) final examination questions related to the content in the modules.

Instructors will develop at least one class assignment to reinforce concepts learned through the online modules. This may be a homework problem or a project. An external consultant familiar with entrepreneurial thinking will assist faculty members develop the assignment.

The content experts who develop the online modules also provide sample questions that can be used in the final exams of the courses into which modules are integrated. Instructors are expected to have at least one question related to the online modules integrated in their courses in

the final examination. Some sample final exam questions for the *Building, Sustaining and Leading Effective Teams* module are given in Appendix B.

Student behavior/mindset growth related to entrepreneurial thinking will be assessed through the following two types of survey instruments and studies:

1. **Program-Level Assessment:** The baseline survey shown in Appendix C will be administered to entering freshmen before they have completed any online module. Psychological measurement theory suggests that lengthy questionnaires can lead to low response rates and distorted responses due to fatigue.^{10,11} Therefore, the survey was designed to be concise with 37 items. Students' general entrepreneurial mindset such as the intellectual and exploratory curiosity levels, interests and experiences in entrepreneurship, career goals, etc. will be measured through 12 items. The learning outcomes of the 18 online modules will be measured through 25 items, with one or at most two questions related to each module.

The baseline survey will be administered a second time when students complete their BS programs. All students will have taken at least 13 of the 18 online modules by the time they graduate. Some students will have taken all 18 modules. The survey results at the beginning and end of each student's program will be compared to assess how the totality of the proposed online modules improve student growth in general entrepreneurial mindset/behavior. Students who take the Business Fundamentals for Engineers class and thereby complete all 18 modules will be grouped separately in the analysis.

2. **Course-Level Assessment:** In each course into which a module is integrated, students will also be administered a module-specific survey at the beginning of the course before the module is deployed. This will serve as a pre-assessment of student awareness of the entrepreneurial characteristics that students are expected to develop after completing the module and reinforcement assignment. The module-specific surveys for the *Developing Customer Awareness* and *Learning from Failure* modules are shown in Appendices D and E.

Students will be administered the same module-specific survey as a post-assessment at the end of a course in which a module is integrated. The survey results from the beginning and end of each course, together with each module's content assessment results, will indicate how well students learn the content of each module.

The third type of assessment will be the collection of student feedback regarding each online module. Specific questions related to the effectiveness and relevance of the online module integrated into a course will be included in the regular end of semester course evaluation.

Results of the three types of assessments will be used to improve the structure, content and integration of each online module.

Conclusions

The development and implementation of online modules designed to promote entrepreneurial thinking of engineering students is described. When complete in December 2016, a total of 18 online modules will have been developed. The modules will be integrated into existing engineering courses and a new Business Fundamentals for Engineers course. Approaches to assess student learning of entrepreneurial thinking through deployment of the modules and course assignments designed to reinforce the content of the modules are described. Assessment of learning will be conducted at both the course and program level.

Acknowledgement

The Kern Family Foundation funded the development and implementation of the online modules in the Tagliatela College of Engineering at the University of New Haven. We are thankful to Karen Wilken, a program manager at the foundation, for her interaction and feedback throughout the project.

Appendix A — Sample Class Discussion Question

(From Instructor's Manual for *Cost of Production* module)

Open-Ended Problem: Develop a Business Plan

Learning Objective:

- Calculate the total cost to produce a bicycle at an affordable price.

Teaching Note: This discussion thread can be offered near the end of the module or after the module is completed as a class assignment. You can use this discussion as a group exercise in class (with modification) or use a learning management system to complete it online.

You and several friends discuss that you are always late for class and determine that riding a bike to class would make that problem go away. You and your friends visit the local bike shop and determine that the bikes cost more than you thought. Develop a plan to sell bikes to your fellow students at an affordable price. In your plan answer the following questions:

1. What are the possible options available to you and your fellow entrepreneurs?
2. How much funding will you need?
3. How would you determine your needs?
4. What are some of the options for raising funds?
5. How will you determine the need for additional funding after you launch the business?

Instructions:

Initial Post

Create a thread (online discussion option) that outlines your planning process in response to the questions posed.

Follow up Discussion

After reviewing the responses of your peers, consider whether their planning processes will be successful in launching a business.

Respond to Posts

Review and comment on at least two other posts in the follow up discussion. Follow netiquette protocol and extend off (add to) an observation and or comment on an insight you had not considered.

Deadline:

Ideally (in an online environment), students will have a few days between the initial post and responses.

Appendix B — Sample Final Exam Question

(Fill-in-the Blank and Multiple Choice Questions from Instructor's Manual for *Building, Sustaining, and Leading Effective Teams and Establishing Performance Goals* module)

Fill-in-the Blank

- 1) Understanding your personal KSAs and ambitions allows you to be a high performing member of the team. Being aware of one another's personality types can improve team functionality. _____ can positively impact team performance by aligning individual and team performance goals.
[Answer: Shared expectations]
- 2) The following are steps in _____. [Answer: Project Planning]
 - a. Review the project assignment (mission) for any specific measures and deadlines.
 - b. Break down the major goals into smaller deliverables.
 - c. Self-assign deliverables
 - d. Set up a weekly meeting schedule that includes time for individuals to report on their progress and receive feedback.
- 3) ORID is an acronym for four different viewpoints or ways to address a problem or issue. The ORID process uses question prompts to explore problems from these four different lenses. They are _____.
[Answer: Objective, Reflective, Interpretative, Decisional]
- 4) The following considerations make up a checklist to help you think about your role with the _____. [Answer: team]
 - What do you learn from the team?
 - What are your objectives from this project?
 - What is it that you want to gain from participating in this project?
 - What resources will it take to help you be successful?
 - How to know when you have met your mark?

Multiple Choice

- 5) What factor(s) do **not** improve the probability that a team will be more productive? Choose all that apply.
 - a. Team members have an understanding of the team life-cycle model
 - b. At least one member of the team helps the group work toward finding a consensus
 - c. Taking time to discuss feelings is a waste of time. [ANSWER]
 - d. It is not enough to just want an outcome; you have to be willing to work for it.

Appendix C — Baseline Survey

Definition: An entrepreneur is a person who starts a business and is willing to take on a greater than normal financial risk in order to do so.

Please rate your level of agreement with the following questions:

		I don't understand	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	I have a keen sense of curiosity						
2	When I see a complicated piece of machinery, I always like to find out how it works						
3	I always actively seek as much information as I can in a new situation						
4	I consider myself to be a person who takes action when I'm curious about something.						
5	I find myself being curious about a lot of things and people I encounter in life.						
6	I have at least one area of interest that I am passionate about in my life.						
7	I think business value creation is the company owner's concern						
8	I am able to define an engineering problem in terms of value creation						
9	I think business risk assessment is the business manager's duty						
10	I have no idea how to assess business risk						
11	I am able to learn from failure						
12	I believe the ability to cope with failure can be improved through training						
13	I am able to act effectively and creatively in difficult situations						
14	I am able to use the means at my disposal to handle situations effectively						
15	I have the ability to anticipate technical developments by interpreting surrounding <i>societal</i> trends						
16	I have the ability to anticipate technical developments by interpreting surrounding <i>economic</i> trends						
17	I pay attention to the inefficiency in the market						

		I don't understand	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
18	I actively think about how to correct inefficiencies in the market						
19	I agree creative thinking skills can be acquired through training						
20	I sometimes have innovative ideas for products or services						
21	I believe a problem can be understood better if it is considered in relation to the whole						
22	I am able to apply systems thinking to solve complex problems						
23	I am able to tell if it is technically feasible to develop a new product or service						
24	I am able to apply logical thinking to gathering and analyzing information						
25	I am able to apply logical thinking to designing and solving problems						
26	I am confident in leading a team to work on a project						
27	I always maintain a good interpersonal relationship in a team						
28	I am able to identify potential stakeholders for a new product or service						
29	I am able to address stakeholder interests in a business plan						
30	I am able to communicate an engineering solution in economic terms						
31	I am able to substantiate claims with data and facts						
32	I have a clear plan for my professional development						
33	My career goal is to become an excellent engineer						
34	My career goal is to become an engineer with an entrepreneurial mindset						
35	I have had exposure to entrepreneurship before entering college						
36	There is/are entrepreneur(s) among my relatives						
37	I'd like to take some entrepreneurship courses in college						

Demographic Data About Yourself:

Name: _____ Student ID: _____

Major (check the correct one):

Computer Science/Information Technology _____ Electrical Engineering/Computer Engineering _____

System Engineering _____

Mechanical Engineering _____

Civil Engineering _____

Chemical Engineering/Chemistry _____

General Engineering _____

Undecided _____

Second major or minor (if there is one): _____

Gender: _____ Age: _____

Residence:

Domestic _____

International (indicate your country) _____

Have either of your parents earned a college degree?

Yes _____ No _____

Do you have formal work experience?

Yes (how many years?) _____ No _____

Appendix D — Module-Specific Survey for Assessing Developing Customer Awareness Module

Please rate your level of agreement with the following questions:

		I don't understand	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	I can define customer value						
2	I can list the basic factors attributed to customer value						
3	In engineering design, product quality is more important than product cost						
4	All consumers place the same customer value on the same product or service						
5	Customer engagement usually occurs after a product is developed						
6	I can list the basic customer engagement techniques						
7	Innovation comes before customer engagement						

Name _____ Date _____ Instructor _____

Appendix E — Module-Specific Survey for Assessing Learning from Failure Module

Please rate your level of agreement with the following questions:

		I don't understand	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
1	There is a major difference in mindset between failure in engineering and entrepreneurial failure						
2	If an entrepreneur fails publicly, it is likely to ruin his or her career for life						
3	You can only fail if you try, so it is best not to try						
4	It is better to fail once spectacularly at the end of an entrepreneurial venture than it is to fail several times at the start of a venture						
5	Failure occurs due to personal shortcomings						
6	If you fail, but understand why you failed, you are less likely to fail in the future						
7	Most successful entrepreneurs have failed many times in the past, and do not expect to fail anymore in the future						
8	Whether you evaluate risk in an engineering effort or in an entrepreneurial effort, you should always evaluate the risk and assess the potential consequences of failures						

Name _____ Date _____ Instructor _____
