Abstract
In electrical engineering, specifically in Electric Power Systems linear algebra is used widely throughout the curriculum. More specifically in electric power systems, short circuit analysis requires the determination of impedance bus matrices \( Z_{bus} \). Admittance bus matrices, \( Y_{bus} \), are used in load flow analysis amongst other applications. The classic manipulation of these matrices has been done using high-level programs such as FORTAN and C. With the introduction of mathematical packages such as MATLAB and MATHCAD we have reduced the time being consumed in the solution of such matrices and focus more in the techniques and analysis of the results. This paper will attempt to demonstrate the usage of MATLAB in the solution of linear algebra problems in the analysis of electric power systems specifically in the use of the “building algorithm” and Kron’s reduction.

Kron’s\(^1\) reduction (Node Elimination)
The size of a real \( Y_{bus} \) admittance matrix, is very large. Computational time can be a problem, therefore, we needed to come up with algorithms to reduce the size of such matrix. The selection of the buses to be eliminated (in order to reduce the size of the matrix) is usually determined by the fact that there is no current being injected and/or the bus is of no importance to the analysis. As a rule if there is no external load and/or there are not generating sources connected then we can eliminate such bus.

When we want to eliminate a bus, we use the method of Kron’s reduction. We simply identify the buses that are not active, or do not have an effect on the system. In our example it would be buses 5 and 6. The size of our matrix is a 6 by 6 (nxn).

Kron’s reduction method is given as:

\[
Y_{jk\text{(new)}} = Y_{jk} - \frac{Y_{jp} Y_{pk}}{Y_{pp}}
\]

\(^1\) Named after Dr. Gabriel Kron. 1901-1968. General Electric
“p” is the bus number to be eliminated.
“j” row
“k” column
j and k take values from 1 to n

Therefore $Y_{bus}$ (new) has a new dimension (n-1)(n-1).

**Step-by-step analysis (This is the “building algorithm”)**
The circuit shown below, figure 1 [1], is called a “reactance diagram.” We use the building algorithm to obtain the $Y_{bus}$ matrix that represents the diagram. In our class we teach this algorithm step-by-step with an example. We obtain $Z_{bus}$ first then by inverting it we find $Y_{bus}$. Be aware that the “building algorithm” is a sequence of steps to create $Z_{bus}$. In this paper we show step by step such procedure.

The diagram below represents a typical electric system [6]. Suffice to say that each inductor, called reactance” represents a model for a specific electric component. For example the reactance j0.20 and the voltage source indicated on the left both represent a synchronous generator.

![Diagram of electric system](image)

Figure 1. “Reactance diagram.” Numbers inside circles are buses.

**Building algorithm. STEP 1**
Add branch 1 to reference node (One bus has been created then we have a 1 by one size matrix)

$$[j0.20]$$

Matlab Code [5]:

```matlab
z=[0.20i];
```

“Proceedings of the 2003 American Society for Engineering Education Annual Conference & Exposition Copyright © 2003, American Society for Engineering Education”
Building algorithm. STEP 2
Add branch between bus 1 and 5 (we are creating another bus, therefore the size of our matrix is 2 by 2) So, every time we create a new bus we increase the size of the matrix by one.

\[
\begin{bmatrix}
  j0.20 & j0.20 \\
  j0.20 & j0.24 
\end{bmatrix}
\]

Matlab Code:
```
size=2;
z0=0.04i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:size-1;
z(size-i,size)=z(size-i,size-1);
z(size,size-i)=z(size-1,size-i);
end;
```

Building algorithm. STEP 3
Add branch between buses 5 and 2 (a third bus is being added, consequently the size of our matrix is 3 by 3)

\[
\begin{bmatrix}
  j0.20 & j0.20 & j0.20 \\
  j0.20 & j0.24 & j0.24 \\
  j0.20 & j0.24 & j0.28 
\end{bmatrix}
\]

Matlab Code:
```
size=3;
z0=0.04i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:size-1;
z(size-i,size)=z(size-i,size-1);
z(size,size-i)=z(size-1,size-i);
end;
```

Building algorithm. STEP 4
Add branch between buses 2 and 3 (a fourth bus is added and the size of our matrix is 4 by 4)
Matlab Code:
size=4;
zb=0.15i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:(size-1);
z(size-i,size)=z(size-i-1,size-1);
z(size,size-i)=z(size-1,size-i);
end;

Building algorithm. STEP 5
Add branch between buses 3 and 6 (a new bus is added and now we have a 5 by 5 matrix)

Matlab Code:
size=5;
zb=0.04i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:(size-1);
z(size-i,size)=z(size-i-1,size-1);
z(size,size-i)=z(size-1,size-i);
end;

Building algorithm. STEP 6
Add branch between buses 6 and 4 (A new bus is added and we have a 6 by 6 matrix)
Matlab Code:

\[
\begin{bmatrix}
0.20 & 0.20 & 0.20 & 0.20 & 0.20 \\
0.20 & 0.24 & 0.24 & 0.24 & 0.24 \\
0.20 & 0.24 & 0.28 & 0.28 & 0.28 \\
0.20 & 0.24 & 0.28 & 0.43 & 0.43 \\
0.20 & 0.24 & 0.28 & 0.43 & 0.47 \\
0.20 & 0.24 & 0.28 & 0.47 & 0.51 \\
0.20 & 0.24 & 0.28 & 0.47 & 0.71 \\
\end{bmatrix}
\]

Matlab Code:

```
size=6;
z=0.04i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:(size-1);
z(size-i,size)=z(size-i,size-1);
z(size,size-i)=z(size-1,size-i);
end;
```

**Building algorithm. STEP7**

Add branch from existing bus 4 to existing reference node. In this case we need to reduce the matrix to a 6 by 6 size using the method of Kron’s reduction. We need to reduce the 7th column and row.

Matlab code to obtain the 7-by-7 matrix

```
size=7;
z=0.20i;
z(size,size)=z(size-1,size-1)+zb;
for i=1:(size-1);
z(size-i,size)=z(size-i,size-1);
z(size,size-i)=z(size-1,size-i);
end;
```
Matlab code to reduce a 7-by-7 to a 6-by-6 matrix

\[ \text{size}=7; \% \text{current matrix size} \]
\[ \text{remove}=7; \% \text{remove= which row/column to remove} \]

\[
\text{for } jj=1:(\text{size}) \\
\quad \text{if } jj \neq \text{remove}; \quad j=jj; \\
\quad \quad \text{if } jj \geq \text{remove}; \quad j=j-1; \\
\quad \text{end} \\
\quad \text{for } kk=1:(\text{size}) \\
\quad \quad \text{if } kk \neq \text{remove}; \quad k=kk; \\
\quad \quad \quad \text{if } kk \geq \text{remove}; \quad k=kk-1; \\
\quad \quad \text{end}; \quad z_{\text{new}}(j,k)=z(jj,kk)-z(jj,\text{remove})*z(\text{remove},kk)/z(\text{remove},\text{remove}); \quad \text{end}; \\
\quad \text{end}; \quad \text{end}; \quad \text{end}; \quad \text{end}; \quad \text{end}; \quad \text{end}; \\
\]

The first term \( (a_{11}) \) is obtained by hand to show how the method of Kron’s reduction works:

\[
Z_{11} = Z_{11} - \frac{Z_{17}Z_{71}}{Z_{77}} = j0.20 - \frac{(j0.20)(j0.20)}{j0.71} = j0.14366 \ \Omega_{pu} \\
\]

Where “pu” [4] is per-unit. (Basically it is a percentage)

Output matrix reduced to a 6 by 6 size.

Columns 1 through 4

\[
\begin{array}{cccc}
0 + 0.1437i & 0 + 0.1324i & 0 + 0.1211i & 0 + 0.0789i \\
0 + 0.1324i & 0 + 0.1589i & 0 + 0.1454i & 0 + 0.0946i \\
0 + 0.1211i & 0 + 0.1454i & 0 + 0.1696i & 0 + 0.1104i \\
0 + 0.0789i & 0 + 0.0946i & 0 + 0.1104i & 0 + 0.1696i \\
0 + 0.0676i & 0 + 0.0811i & 0 + 0.0946i & 0 + 0.1454i \\
0 + 0.0563i & 0 + 0.0676i & 0 + 0.0789i & 0 + 0.1211i \\
\end{array}
\]

Columns 5 through 6

\[
\begin{array}{ccc}
0 + 0.0676i & 0 + 0.0563i \\
0 + 0.0811i & 0 + 0.0676i \\
0 + 0.0946i & 0 + 0.0789i \\
\end{array}
\]
0 + 0.1454i 0 + 0.1211i
0 + 0.1589i 0 + 0.1324i
0 + 0.1324i 0 + 0.1437i

**Building algorithm. STEP 8**
Rows and columns 5 and 6 can be eliminated since we assume that there are no loads and/or any current injection.

**Matlab program**
First we are going to write the program that will obtain the complete matrix without any reduction. It does match the step-by-step sequence shown in the previous section. The outputs match exactly the matrices obtained before.

```matlab
% For Zbus
% Add branch 1 to reference node
z = [0.20i];
za = z
% Add branch 2 between buses 1 to 5
size = 2;
zb = 0.04i;
z(size, size) = z(size-1, size-1) + zb;
for i = 1:(size-1);
z(size-i, size) = z(size-i, size-1);
z(size, size-i) = z(size-1, size-i);
end;
zb = z
% Add branch 3 between buses 5 to 2
size = 3;
zb = 0.04i;
z(size, size) = z(size-1, size-1) + zb;
for i = 1:(size-1);
z(size-i, size) = z(size-i, size-1);
z(size, size-i) = z(size-1, size-i);
end;
zc = z
% Add branch 3 between buses 2 and 3
size = 4;
zb = 0.15i;
z(size, size) = z(size-1, size-1) + zb;
for i = 1:(size-1);
z(size-i, size) = z(size-i, size-1);
z(size, size-i) = z(size-1, size-i);
end;
zd = z
% Add branch 4 between buses 3 and 6
```

0 + 0.0902i & 0 + 0.1082i & 0 + 0.1263i & 0 + 0.0439i \\
0 + 0.0314i & 0 + 0.0376i & 0 + 0.0439i & 0 + 0.0675i \\
0 + 0.0157i & 0 + 0.0188i & 0 + 0.0220i & 0 + 0.0337i \\
\end{array}
\]
Column 5
\[
\begin{array}{c}
0 + 0.0157i \\
0 + 0.0188i \\
0 + 0.0220i \\
0 + 0.0337i \\
0 + 0.0369i \\
\end{array}
\]
\[ z3 = \text{reduced from a 5 by 5 to a 4 by 4 matrix size. Elimination of bus number 5} \]

\[
\begin{bmatrix}
0 + 0.1149i & 0 + 0.0979i & 0 + 0.0809i & 0 + 0.0170i \\
0 + 0.0979i & 0 + 0.1174i & 0 + 0.0970i & 0 + 0.0204i \\
0 + 0.0809i & 0 + 0.0970i & 0 + 0.1132i & 0 + 0.0238i \\
0 + 0.0170i & 0 + 0.0204i & 0 + 0.0238i & 0 + 0.0366i
\end{bmatrix}
\]

For \( Y_{bus} \), we need to take the inverse of \( Z_{bus} \). This is done with a simple command as it can be shown below.

\[
Y_{bus} = \text{inv}(z3)
\]

\[
Y_{bus} = \\
0 -30.0000i & 0 +25.0000i & 0 + 0.0000i & 0 - 0.0000i \\
0 +25.0000i & 0 -50.0000i & 0 +25.0000i & 0 + 0.0000i \\
0 + 0.0000i & 0 +25.0000i & 0 -31.6667i & 0 + 6.6667i \\
0 - 0.0000i & 0 + 0.0000i & 0 + 6.6667i & 0 -31.6667i
\]

**Conclusions**

As it was shown in figure 1, we need to know the electric system that we must analyze. Then we need to convert actual values of reactance from the models of electric equipment to per-unit values and create what we call the reactance diagram. Once this diagram is created it is our task to obtain the \( Z_{bus} \) matrix. By inverting the \( Z_{bus} \) matrix we can find \( Y_{bus} \) matrix. The program written in MATLAB took very little time to write and runs as fast as any higher-level programming language. Our students enjoy this experience because of the fact that changes to the reactance matrix can be done very easily and running the program to find the answer is a matter of seconds. Therefore we focus on the answers, the algorithm, system changes and ultimately the understanding of the material.
