Enhancing Verification and Validation Education Using Active Learning Tools Developed through an Academia-Industry Partnership

Dr. Sushil Acharya, Robert Morris University

Acharya joined Robert Morris University in Spring 2005 after serving 15 years in the Software Industry. His teaching involvement and research interest are in the area of Software Engineering education, Software Verification & Validation, Data Mining, Neural Networks, and Enterprise Resource Planning. He also has interest in Learning Objectives based Education Material Design and Development. Acharya is a co-author of "Discrete Mathematics Applications for Information Systems Professionals- 2nd Ed., Prentice Hall". He is a member of Nepal Engineering Association and is also a member of ASEE, and ACM. Acharya was the Principal Investigator of the 2007 HP grant for Higher Education at RMU. In 2013 Acharya received a National Science Foundation (NSF) Grant for developing course materials through an industry-academia partnership in the area of Software Verification and Validation. Acharya is also the Director of Research and Grants at RMU.

Dr. Priya Manohar, Robert Morris University

Dr. Priyadarshan (Priya) Manohar Dr. Priyadarshan Manohar is an Associate Professor of Engineering and Co-Director Research and Outreach Center (ROC) at Robert Morris University, Pittsburgh, PA. He has a Ph. D. in Materials Engineering (1998) and Graduate Diploma in Computer Science (1999) from University of Wollongong, Australia and holds Bachelor of Engineering (Metallurgical Engineering) degree from Pune University, India (1985). He has worked as a post-doctoral research fellow at Carnegie Mellon University, Pittsburgh (2001 – 2003) and BHP Institute for Steel Processing and Products, Australia (1998 – 2001). Dr. Manohar held the position of Chief Materials Scientist at Modern Industries, Pittsburgh (2003 – 2004) and Assistant Manager (Metallurgy Group), Engineering Research Center, Telco, India (1985 – 1993). He has published over 70 papers in peer-reviewed journals and conferences including a 2007 Best Paper Award by the Manufacturing Division of American Society for Engineering Education (ASEE), three review papers and five book chapters. He has participated in numerous national and international conferences. He is a member of ASM International, TMS, ACerS, AIST, ASEE, and a registered Chartered Professional Engineer. Dr. Manohar’s research interests include mathematical and computer modeling of materials behavior, thermo-mechanical processing of steels and other metallic materials, microstructural characterization, and structure – property relationships. He has conducted a number of technical failure investigations, consulted on various materials-related problems, and acted as an expert witness in the Court of Law. Dr. Manohar is the past chair of the Manufacturing Division of ASEE and also of the ASM Pittsburgh Chapter.

Dr. Walter W Schilling Jr., Milwaukee School of Engineering

Walter Schilling is an Associate Professor in the Software Engineering program at the Milwaukee School of Engineering in Milwaukee, Wisconsin. He received his B.S.E.E. from Ohio Northern University and M.S. and Ph.D. from the University of Toledo. He worked for Ford Motor Company and Visteon as an Embedded Software Engineer for several years prior to returning for doctoral work. He has spent time at NASA Glenn Research Center in Cleveland, Ohio, and consulted for multiple embedded systems companies in the Midwest. In addition to one U.S. patent, Schilling has numerous publications in refereed international conferences and other journals. He received the Ohio Space Grant Consortium Doctoral Fellowship and has received awards from the IEEE Southeastern Michigan and IEEE Toledo Sections. He is a member of IEEE, IEEE Computer Society and ASEE. At MSOE, he coordinates courses in software quality assurance, software verification, software engineering practices, real time systems, and operating systems, as well as teaching embedded systems software.

Dr. Peter Y Wu, Robert Morris University

Peter Y. Wu is professor of Computer and Information Systems at Robert Morris University. He earned Ph.D. in Computer System Engineering from Rensselaer Polytechnic Institute. He worked for IBM Research Division, first as a post-doc research fellow and subsequently a technical staff member at the T.J.
Watson Research Center. He was the chief software engineer and a founding partner of UJB Solutions, LLC, a consulting company in production planning, for two years. He previously held faculty appointments at Hong Kong Polytechnic University, and the University of Pittsburgh. His current research interests are in software engineering, and geographic information systems.
Enhancing Verification and Validation Education using Active Learning Tools Developed through an Academia-Industry Partnership

Abstract
Imparting real world experiences in a software verification and validation (SV&V) course is often a challenge due to the lack of effective active learning tools. This pedagogical requirement is important because graduates are expected to develop software that meets rigorous quality standards in functional and application domains. Realizing the necessity of such teaching tools, the authors designed and developed eighteen (18) delivery hours of Case Studies, sixteen (16) delivery hours of Class Exercises, and six (6) delivery hours of Video Case Studies for use in courses that impart knowledge on SV&V topics viz. requirements engineering, software reviews, configuration management, and software testing. Four key skill areas sought after by employers, namely communication skills, applied knowledge of methods, applied knowledge of tools, and research exposure are used to drive the development funded by a National Science Foundation grant and perfected through an industry-academia partnership.

In this paper, we discuss in detail the four project plans the researchers and their industry counterparts followed over the past two years in the development and eventual dissemination of active learning tools. A course enhancement plan was used to drive activities related to reviewing, enhancing, and modularizing modules, identified by a gap analysis performed by focus groups comprised of industry and academic partners. The course delivery plan was used to drive activities related to developing content delivery strategies. An evaluation and assessment plan was used to drive activities related to periodically evaluating student learning and assessing the project. And finally a course dissemination plan is being used to drive activities related to disseminating course modules and assessment reports. Active learning tools have been disseminated through a workshop and other means to universities and industry partners.

1 Project Introduction
With almost half of the world’s population (3.4 billion) relying on the internet, it has become nearly impossible to avoid the software footprint in everyday life \(^{[1]}\). Software is now ubiquitous and software has also become critical. In 2015, major software glitches affected numerous companies: Bloomberg (inoperable trading terminals), Royal Bank of Scotland (payments failure), Nissan (airbag sensory detectors malfunction), Starbucks (register malfunction) and the F 35 Joint Strike Fighter (targets detection failure). Each of these resulted in financial, brand, and more important bodily damages \(^{[2]}\). With mission critical and high-risk applications that have human lives and resources dependent on software applications, it is imperative to not only test for, but aim for zero defects. However, even after decades of development, the software industry continues to spend considerable time and resources dealing with the quality problem. In the US alone in 2007, the cost of failed software was estimated to be upwards of \$75 billion in re-work costs and abandoned systems \(^{[3]}\).

The fundamental challenge towards a solution that will improve software quality lies in the people and processes that develop and produce software. Acharya et al (2014) \(^{[4]}\) reason that
firstly, there is not enough awareness of the Software Verification & Validation (SV&V) benefits, and secondly, there are a lack of practitioners who understand the SV&V topics and processes adequately. Both the lack of awareness and personnel shortage considerably hinder significant progress in project success rates. Furthermore, Acharya et al [4] argue the root cause to be the lack of up-to-date SV&V courseware. To address this situation, a SV&V course curriculum has been improved at the author’s institution through a project funded by a National Science Foundation – Transforming Undergraduate Education in Science, Technology, Engineering, and Mathematics (NSF-TUES) grant.

The goal of this project is to enhance and transform a SV&V course by incorporating academic research and industry best practices through an academia-industry partnership. This project achieved the following objectives:

1. Critically examined the existing SV&V course contents,
2. Identified areas where improvements could be made in pedagogy,
3. Developed 42 delivery hours of active learning tools,
4. Developed course delivery strategies,
5. Integrated and delivered new pedagogical tools in the course,
6. Performed assessments and evaluations of the effectiveness of these tools,
7. Disseminated course modules and assessment reports.

At this time dissemination to more institutions is being carried out.

This project, scheduled for completion in August 2016, targets both undergraduate students and software practitioners and:

1. Improves SV&V knowledge and skills of students & practitioners,
2. Helps evolve a SV&V community,
3. Improves SV&V teaching and learning opportunities.

The end result is expected to improve product and process quality levels in the software development community, resulting in a larger and more skilled SV&V user community. This paper introduces this project, describes the academia-industry partnership, and provides an in-depth description of the project’s execution and outcomes.

2  Project Partners
Academia-industry partnership is the key to achievement of the project outcomes. From the conceptual stage, it was believed that by working hand in hand with the industry, both the academia and industry would benefit. Students would gain knowledge that is currently practiced in the industry and which they would likely use in their professional career, and industry would be able to train/retrain their personnel using a tested delivery strategy.

2.1  Industry Partners – Formation and Role
Understanding project requirements, studying possible partnerships, and selling the project vision was instrumental in getting the industry on-board. Three industry partners—Eaton Electrical Corporation, ServiceLink, and JDA Software Group— have supported this project from the time it was conceived. Additional partners, PNC Bank and ANSYS, were invited as this project progressed and the need for diversification was realized. These companies are either large software companies or companies with large software development activities in the areas of mortgage, intelligent pricing and revenue management, electrical meters, and engineering simulation. The project team is open to more industry joining the partnership but is selective in the industry domain. The role of the industry partner is well defined and involves the following:

- Critically reviewing and identifying knowledge gaps in SV&V courseware
- Assisting in developing course modules
• Delivering expert lecture sessions to undergraduate students at partner universities when requested
• Delivering training programs to industry practitioners
• Assessing student learning

2.2 Academic Partners – Formation and Role
The author’s institute is collaborating with two categories of academic partners: Development Academic Partners and Implementation Academic Partners. These academic partners offer one or more bachelor degrees in the following areas: Software Engineering, Computer Science, Computer Engineering, and Electrical Engineering. These partners also share a strong desire to strengthen their programs.

2.2.1 Development Academic Partner and Activities
Distinguished faculty members from the Milwaukee School of Engineering and Virginia State University (a HBCU partner) have supported this project from the very beginning as Development Academic Partners. Mutual interest is instrumental in this longstanding partnership. The role of the academic development partner is well defined and involves the following:

• Identifying at least one local industry partner involved in software development activities
• Working with assigned focus groups to critically review current course
• Developing six hours of course modules to address identified gaps in a content area familiar to the university program and its local industry partner(s)
• Assessing course contents through at least two delivery cycles

2.2.2 Implementation Academic Partners and Activities
This project calls for delivery of the active learning tools, as well as dissemination of the tools and assessment reports. Six domestic and one international partner have supported this project including: Embry-Riddle Aeronautical University, Montana Tech, University of Michigan, Virginia State University, Fairfield University, Milwaukee School of Engineering, and ORT Braude College, Israel. Partners were identified through networking at the American Society for Engineering Education conferences, sharing of the author’s research. A workshop held in the author’s institute in August 2015 led to the inclusion of five other implementation academic partners namely: Auburn University, East Carolina University, Kennesaw State University, Bowie State University, and Clarion University. The role of the academic implementation partner is well defined and involves the following:

• Using entire or partial courseware developed by this project in at least one course through at least two delivery cycles, and
• Evaluating the course(s) and assessing the instruction at several levels.

In addition, at the request of respective faculty members, the active learning tools have been shared with University of Alaska Southeast, Georgia Southern University, University of South Carolina–Upstate, Indiana University Southeast, Rose-Hulman Institute of Technology, State University of New York College at Oneonta, and Eastern Mediterranean University (Cyprus).
2.2.3 Focus Groups
To ensure project plans were adequately executed, focus groups comprised of PI and/or co-PIs and academic development partners and industry partners were formed based on individual’s interest and expertise in the project’s four SV&V topic areas: requirements engineering, software reviews, configuration management, and software testing. Well-defined activities carried out by focus groups included the following:

- Researching course contents, understanding industry requirements, identifying inadequacies in the project's SV&V topic areas
- Searching for available SV&V teaching materials
- Developing course contents to address inadequacies
- Assisting in developing evaluation questionnaires and instruments

3 Project Execution
In the past two years, the focus groups have followed phase-wise project plans to accomplish project objectives. A course enhancement plan was utilized to drive activities related to reviewing, enhancing, and modularizing. A course delivery plan was used to drive activities related to developing content delivery strategies. An evaluation and assessment plan was used to drive activities related to periodically evaluating student learning and assessing this project. And finally, a course dissemination plan was (is being) used to drive activities related to disseminating course modules and assessment reports.

3.1 Course Enhancement
Project objectives, target population, SV&V topics, employer-sought key skill areas, and a sound development methodology were used by the focus groups to develop 42 hours of active learning tools consisting of Case Studies, Video Case Studies, and Class Exercises. The following narrative explains the execution of the course enhancement plan.

3.1.1 Course Enhancement Plan
Focus groups used gap analysis to assess the inadequacies of the existing course contents in relation to the SV&V topic areas. They identified knowledge areas (KA), whether a single KA or a combination of KAs, and their accompanying learning objectives. They identified contact hours required for these knowledge areas (KAs) with reference to Software Engineering 2004 [5].

Before the actual development of active learning tools, the focus groups performed a comparison of academic and industry requirements. They also took into consideration the following four key skill areas sought after by employers and identified how they would be accomplished:

i. **Communication Skills:** Students will gain experience in technical communication skills through collaborative learning, Video Case Studies, Class Exercises, and technical presentations. This is consistent with IEEE/ACM Curriculum Guideline # 8 [5].

ii. **Applied Knowledge of Methods:** Students will use SV&V methods in the lecture and hands-on sessions. With Case Studies, Class Exercises, Video Case Studies, observing practitioners at work, and expert lecture sessions, students will gain the ability to translate theory to practice. This is consistent with IEEE/ACM Curriculum Guideline # 4 [5].

iii. **Applied Knowledge of Tools:** Students will use SV&V Tools. Hands-on activities will give students experience in the use of SV&V tools for requirements management.
configuration management, defect management, and automated testing. This is consistent with IEEE/ACM Curriculum Guideline # 12\textsuperscript{[5]}.

iv. **Research Exposure:** Students will learn research skills. Students will submit research assignments and participate in research discussions on SV&V related topics. These skills will enable students to learn how to remain current with industry best practices and to make educated decisions in using them.

The groups identified a comprehensive list of Case Studies, Class Exercises, and Video Case Studies.

### 3.1.1.1 Development Methodology

An iterative development methodology depicted in Figure 1 was used to ensure the modules reflected both academic research and industry best practices. The content development process began with a meeting of the focus groups at the author’s institution. The groups drafted a list of active learning content topics and delivery formats. The list was reviewed by the PI and co-PIs and shared with the partners for further review. The finalized list was then used to guide the development process. In this methodology, an industry partner or academic partner led the development effort through a collaborative effort. Once the contents were ready for review, they were shared with focus group members and subsequently with all partners. The finalized contents were then transferred to a shareable media where they became available for delivery, further reviews, and dissemination. For ease of adaptation, each active learning tool is of 25 minutes duration, with some active learning tools having multiple parts delivered in multiple sessions.

#### Figure 1: Development Methodology

![Development Methodology Diagram]

### 3.1.1.2 Focus Group Meetings

Focus groups have met multiple times at the author’s institution. In addition conference calls, phone calls and emails have been used for timely communication amongst group members.

### 3.1.2 Active Learning Tools

This project has developed three categories of active learning tools:

- **Case Studies:** Case Studies serve as useful tools to teach software methods & processes. Raju and Sankar\textsuperscript{[6]} define Case Study education as providing students with a record of a technical and/or business issue that actually has been faced by managers, together with surrounding facts, opinions, and prejudices upon which management decisions have to depend. In this project, Case Studies are drawn from a wide range of industry SV&V practices. Students are presented industry standard documents for review to prepare for the tasks. This project has disseminated eleven Case Studies. Examples of some Case Studies are *Understanding User Requirements*, *A Software Test Plan*, and *Importance of*
Peer Reviews.

- **Class Exercises:** Class Exercises have been designed for the class time to explicitly raise questions to invite student participation. These exercises may be questions to think further into the concepts for a deeper understanding, or practice using student knowledge with hands-on practice for problem solving. This project has disseminated sixteen exercises. Examples of some Class Exercises are *Requirements Ambiguity, Defect Lifecycle,* and *IEEE Standards.*

- **Video Case Studies:** Videos are viewed as an effective method of presenting standard material while addressing students of different learning styles. In this project, the Video Case Studies provide a realistic picture for the audience to appreciate many SV&V processes being practiced. The video scripts were first drafted by the industry partners and subsequently confirmed by the testimonies shared in focus group discussions. Four videos, ranging from 15 to 24 minutes, have been disseminated. Some Video Case Study titles are *Formal Inspection Scenes* and *Requirement Analysis Scenes.*

### 3.2 Course Delivery

The following narrative explains the development, execution, and revision of the course delivery plan.

#### 3.2.1 Course Delivery Plan

With the active learning tools designed to impart practical knowledge into theoretical understanding, we encourage a flipped classroom model in which we can maximize class time for active learning tools so as to engage the students for further digestion of the knowledge in the context of industry practices. Students are expected to be prepared outside of the classroom beforehand, with assigned textbook readings or reviewing of online materials. For ease of dissemination and, more importantly delivery, an instructor packet consisting of sample course syllabus, pre/post-tests, mid-term/final exam samples, and the active learning tools has been created. Each active learning tool module consists of the following components:

a) Active learning tool description  
b) Instruction notes  
c) Student handout  
d) Assessment instrument

The active learning tools are built on basic knowledge and engage the students in different ways to study SV&V in practice. The Case Studies are explicit in this approach: each Case Study makes the point to consider issues in realistic practices. Instructors can present the Case Study while guiding students into further study and discussion of the practical issues in SV&V. The Class Exercises are designed for interaction in the classroom during group discussions. The instructor brings the question(s) as the moderator and guides the discussion session. Depending on class size, students may be sub-divided into small groups. The instructor may also use the Class Exercise to lead students into subsequent group mini projects or individual mini projects. The Instructor Notes component of the Class Exercise discusses these possibilities. Students are likely to find the Video Case Studies by their nature as multimedia, as highly engaging. These videos share real-life perspectives of actions and their consequences. The videos are by design in sequences of scenes. For instructional purposes, it is highly beneficial to
“pause” the video at appropriate moments so as to engage the students in discussion. Suggested discussion questions accompany the videos.

As mentioned before, the active learning tools are modularized into flexible modules. Instructors may consider their various needs such as curriculum design, class time, and class size to adapt the active learning tools to the situations in their institutions. Furthermore, though we recommend it, instructors do not need to practice the flipped classroom model or may do so partially.

To summarize, the course delivery plan encourages the following:
- Using the flipped classroom model (if applicable)
- Delivering tools in one or multiple 25-minute sessions
- Using pre-test and post-test instruments to tailor course delivery
- Evaluating student learning of the module immediately after delivery

A week-by-week course delivery plan, developed by the focus groups, was used to deliver a course on SV&V at the author’s institute in spring 2015. The feedback from the students and the instructor was used to revise the tools and the delivery plan. Table 1 depicts the revised delivery schedule being used at the author’s institute in spring 2016 delivery of the same course. At the author’s institute this 3-credit course meets 4 hours a week.

3.2.2 Roles and Responsibilities
The academic implementation partners have started implementation at various levels of adaptation in their respective institutions in their fall 2015 and/or spring 2016 deliveries. The industry partners are considering taking selected tools to use in their on-the-job training for practitioners.

3.2.2.1 Delivery at Partner and other Academic Institutions
It is recommended that the Academic Institutions follow a similar delivery plan. However, they may choose to offer the enhanced course materials as a new course offering or as modules that fit into their existing course offerings. Partners may also supplement contents with locally developed materials. These supplemental materials will be part of the course repository if the PI and the partners agree that such materials add to student learning and teaching of such materials can be easily replicated by implementing instructors.

3.2.2.2 Delivery at Industry Facilities
Industry partners local to the author’s institute are considering delivering specific modules to their employees at their facilities or at the author’s institution. During assessment periods, industry partners will deliver selected modules and provide assessment results.

Using the provided assessment tools, both academic and industry implementation partners are expected to have their students and instructor(s) complete surveys pertaining to the tools delivered and the delivery strategy
Table 1: Delivery Schedule

3.3 Project Assessment and Evaluation

Project assessment and evaluation are important activities in this project. The following narrative explains the overarching project goals, followed by a description of the assessment and evaluation plan by both internal and external evaluators. The narrative also provides samples of actual assessments conducted by the different stakeholders. Various stakeholders in this project
include the students (SIR II surveys and in-class feedback surveys), faculty (faculty course assessment reports), industrial and academic partners (surveys) and external evaluators (surveys and assessment reports). Each of the stakeholders have been completing work diligently, and there is an abundance of information available at this stage to identify the strengths and weaknesses of this project, and then chart out the future course of action as this project moves rapidly in the dissemination and conclusion phase.

3.3.1 Project Assessment and Evaluation Plan
The expected project outcomes that are needed to be assessed by the project evaluators and the suggested evaluation tools are summarized as follows:

- **Outcome 1: Project improves knowledge and skills of students**
  - Suggested assessment tools - outcomes assessment in class (faculty), SIR II surveys (students), industry training feedback (industrial partners/trainers)

- **Outcome 2: Project helps evolve SV&V community** – focus groups work together in developing appropriate pedagogical tools for enhancing SV&V education:
  - Suggested assessment tools – Organization of meetings, workshops and seminars, e-mail based communication, surveys, LinkedIn group membership, revisions, YouTube videos, new curriculum or revision developed and delivered at other institutions, curriculum adaptations (PI, Co-PI responsibility to implement, external evaluators to assess this activity)

- **Outcome 3: Project improves SV&V teaching and learning opportunities**
  - Suggested assessment tools – expanded availability of new teaching and learning tools and materials – books, class notes, Video Case Studies, Case Studies, Class Exercises (PI, Co-PI to implement, external evaluators to assess this activity)

The focus groups have worked with the external evaluators to develop the evaluation questionnaires and instruments for this plan.

3.3.2 Examples of External Project Assessment and Evaluation
The external evaluator was provided with all the student feedback forms, industrial and academic partner feedback forms and also online surveys completed by the developers and users. Based on all of these diverse data sources, the external evaluator submitted a Year-End Program Evaluation report for 2014-15 with the following narrative:

**External Evaluator**
The main project-related activities that were completed for NSF TUES Project # 1245036 during the current reporting year dealt with the development of instructional materials of various types, including nine Case Study modules, eleven Class Exercises, and one Video Case Studies. The instructional materials were developed to allow students to gain experiences in the areas of communication skills, application of methods, application of tools, and research. Furthermore, the content of the materials was grounded in the research literature, and the materials were developed in collaboration with industry experts. The aim of this focused development of instructional materials was to ensure that students are exposed to industry best practice and to relevant aspects of SV&V. With a main focus of project activities being the development of classroom materials, the main focus of the evaluation activities centered on the processes and
practices of materials development. To this end, meeting minutes and feedback from industry partners gathered with a questionnaire provided the data sources that were used to examine the degree to which industry and academic partners were involved in the development of the activities. The activity templates provided another data source related to the development of the activities. A secondary focus of the current year-end evaluation related to student learning and the quality of the instructional materials. To that end, student questionnaire data about the different instructional materials was collected from one class of students at the author’s university who participated in the activities.

The specific questions that were examined in this Year-End Program Evaluation were as follows:

1) To what degree are industry and academic partners involved and satisfied with their involvement in NSF TUES Project # 1245036?
   **Assessment Result:** The data were collected from the industry partners, using a short questionnaire that consisted of closed- and open-ended items. Results show a strong, on-going, frequent communication and collaboration between the academic and industrial partners to identify contemporary and emerging domain-specific issues and topics and then working together to discuss appropriate pedagogical tools to be developed to deliver enhanced learning experiences for the students.

2) To what degree were best-practices in industry and research utilized during development of the instructional materials?
   **Assessment Result:** The evaluation showed that all of the Class Exercises and Case Studies followed the intended template, and all materials required for each class activity have been developed and will be provided to participating instructors for future class sections. Each activity required communication skills and application of course content. The topics and issues delivered in the new active learning tools were based on the brainstorming sessions between the academic and industrial partners to maintain a strong currency of knowledge.

3) To what extent did students learn from and find the newly developed materials to be useful?
   **Assessment Result:** Basic psychometric analysis of the items on each pre- and post-test was conducted, and a paired samples t test was conducted to determine significant differences in the pre- and post-scores. The data show some improvement from pre- to post-test. There was a mean difference of approximately one point, with the post-test scores being higher. It should be noted that the sample size is small (9 students) for utilizing t tests and item analysis, and the Principal Investigators should use the results from these analyses keeping the limitation of sample size in mind. In future semesters, similar analysis will be run based on data collected from a variety of classes at several different institutions, and larger sample sizes are likely to provide more usable information.

3.3.3 Examples of Project Assessment and Evaluation from Academic Partners
Several academic partners adapted the newly developed curriculum to different degrees and also delivered some of the active learning tools. The effectiveness of the curriculum and the tools was assessed based on the data collected from the students, including pre- and post-tests, a general evaluation of course instructional activities, and detailed evaluations of specific pedagogical tools. The data sources collected from students included the following:
• Pre-post Quiz Related to IEEE Standards
• Pre-Post Quiz Related to Configuration Management
• Pre-Post Quiz Related to Requirements, Requirements Engineering, Requirements Management
• Pre-Post Quiz Related to Software Peer Reviews
• Pre-Post Survey on Software V & V Focus Areas
• Post-Only General Student Evaluation of Course Instructional Activities
• Post-Only Student Evaluation of Specific Course Instructional Activities

Assessment Results: Basic psychometric analysis of the items on each pre- and post-test was conducted, and a paired sample t test was conducted to determine significant differences in the pre- and post-scores. It was found that there was significant improvement in students’ post-test scores in the areas of IEEE standards and configuration management. For other areas, there was some improvement, but it is determined to be statistically significant at this time in the data collection process. Some of the assessment questions may need to be rewritten to improve clarity, while for other questions, an increase in the degree of difficulty would help in discerning differences in student learning.

Student feedback about specific pedagogical tools was obtained; this is currently being analyzed quantitatively and will be reported at a later date. Some of the representative comments from the student feedback are summarized below:

• **Security Inspection Video:** This video did facilitate small and large group discussions. I thought the acting in the video was actually pretty decent it portrayed events that could have actually happened.

• **Cost Effective Testing Exercise:** Fun and informative! This was good activity to think critically about how to test a system.

• **Software Requirements Specification (SRS) Review Exercise:** Useful. Very long and detailed. Does look like a real world document but if made shorter could get through entire document.

• **SCRUM Process management Exercise:** I thought the activity is a good instructional way to show what to and not to do in a team meeting. It was a helpful insight for what I need to do when carrying out a big project. This activity certainly showed me the benefits of the scrum process. It was clear to see that frequent communication and reporting of progress will work well to keep a development team on track. It was by far the easiest format to understand the information presented in, and seeing how it is applied in an actual workplace environment clears up so many questions. Good examples like that are very valuable. The do’s and don’ts slides also helped a lot. It makes me wish they made more videos so I could understand other process models’ real world applications like Extreme Programming or the Spiral Model better. I am so glad to understand and I will apply SCRUM to my future work. It’s cool and efficient to keep everything in trace and balance.

3.3.4 Examples of Project Assessment and Evaluation from the Instructor
One of the authors has been delivering a SV&V course since 2005 and is required to perform an
ABET Criterion 3 outcomes assessment. In the spring 2013 term, when the new pedagogical tools were not yet available, there was a weakness associated with the ABET learning outcome ‘e’ (an ability to identify, formulate, and solve engineering problems), where less than 60% of the students scored better than 80% on the assessment tasks. When appropriate Case Studies were developed in 2014 and implemented in the spring 2105 term, the student performance related to outcome ‘e’ rose to the excellent range (>=90%). This presents clear evidence that the Case Study based teaching method is more effective in supporting student learning and increasing the ability to identify, formulate, and solve engineering problems. Therefore, Case Study based educational tools will be progressively developed, adopted, and delivered in several other aspects of the SV&V area such as legal issues in software, software consumer protection, and requirements from the customers’ perspectives. The results of those implementations will be reported later as more data become available.

3.4 Course Dissemination
In consonance with NSF’s broad-dissemination requirement, the project materials and assessment reports have been disseminated through multiple channels. The following narrative explains the execution of the course dissemination plan.

3.4.1 Course Dissemination Plan
- **SV&V Workshop:** In August 2015, the project team hosted a two-day SV&V workshop. Eleven academic implementation partners, including academic development partners, travelled to Pittsburgh, PA. In addition 6 representatives from industry who had participated in the development of materials also attended. The objective of this workshop was to share the course modules and to take the participants through delivery strategies. During this workshop, representatives of focus groups led the participants through a subset of the materials and also explained in detail the delivery strategies. Half a day was allocated for each active learning tool category. It is felt that through this workshop a strong interaction between facilitators and peer learners was established. Both the academic and industrial participants were provided with a set of the larger materials on a flash drive and a link to all exercises in Dropbox (centralized course repository).

- **Centralized Course Repository:** In this project, Dropbox used as the centralized course repository. Forty-two hours of active learning tools have been stored in Dropbox. The items are organized based upon SV&V topics. Folders are provided for activities related to Configuration Management, Requirements Management, Software Reviews, and Software Testing. Underneath each of these folders are folders for the active learning tools: Case Studies, Class Exercises, Video Case Studies, and Topical Assessments. For the workshop participants, four HD-quality Video Case Studies were made available on flash drives. For greater availability, the videos have been uploaded to YouTube. Figure 2 depicts a scene of the Video Case Study as seen in YouTube. Figure 3 below depicts the directory structure of the Dropbox contents.

- **Conferences and Publications:** Research papers on project activities and assessments have been or are in the process of being presented at multiple conferences. To date, conference papers have been presented at ASEE 2014 & ASEE 2015 and EDSIG 2015 annual conferences. This project has been presented at the NSF Showcase at SIGCSE 2016. Research work related to this project has been published in multiple journals. A
A paper will be presented in the *Envisioning the Future of Undergraduate STEM Education: Research and Practice* on April 27-29, 2016 in Washington, D.C. A book on SV&V Case Studies has also been published by the Alexandria Street Press (online).

- **LinkedIn Group:** A LinkedIn group called “Software V&V Community” has been established to enable SV&V implementers to avail themselves of peer-to-peer learning opportunities. This moderated group provides a venue to educate and to consult. Implementers have shared ideas and best practices, asked and answered questions, and collaborated. This group is open to all interested parties.

### 4 Conclusions

Lack of SV&V awareness and more importantly, the shortage of SV&V practitioners poses multitude of problems in the software industry. Imparting real world experiences in academia as well as the industry is a challenge due to a lack of effective active learning tools. Through a vibrant academia-industry partnership and academic research, this project funded by a NSF-TUES grant has developed, delivered, and disseminated 42 delivery hours of active learning tools which include Case Studies, Class Exercises, and Video Case Studies in specific SV&V topics viz. requirements engineering, configuration management, software reviews, and software testing. To date, the active learning tools have been disseminated through a workshop and other means to twenty universities and five industry partners. The dissemination has also taken place through conferences and journal publications. Beyond the enhanced SV&V course itself, this project contributes to the development of the SV&V community, by bridging industry and academic partners. Any software instructor or practitioner interested in gaining free access to the materials developed through this project is encouraged to contact the authors.
