

Information Literacy for Engineering Students

James A. Van Fleet, Nancy Frazier, and Kathleen McQuiston
Bucknell University

All undergraduate students should develop the ability to locate and evaluate information sources. These information literacy skills can help students engage in different ways of thinking and promote academic success. What is the role of information literacy in collaboration, experimentation, problem solving, and learning beyond the classroom - key components of the work of engineers. Are the information literacy needs of engineering students unique? How can they best be met? Join us for a roundtable discussion where we collectively explore the information literacy skills engineering students need to prepare them for the profession. We can hear from each other about the goals and challenges of producing professional engineers who know when and how to use information.
