Improving Mechanical Engineering Students' Programming Skills Through Hands-On Learning Activities Designed in MATLAB Live Editor

Abstract

With the advances and rapid improvements in technology, engineering students are expected to have programming skills to keep up with the evolving demands in their fields. However, among the various engineering programs including mechatronics and robotics, computer, and electrical, mechanical engineering students face the biggest challenge. While they are known to be good problem solvers, they often encounter struggles in programming. This challenge primarily stems from the limited programming courses offered in the curriculum and a lack of exposure to low-cost data acquisition systems like Arduino within their laboratory environments. To give an example, the educational laboratory equipment favorably utilized in mechanical vibrations and control theory courses is tailored with custom software and data acquisition systems to implement inputs and record output data. This inhibits students' understanding of signal flow and data recording. Consequently, students struggle to replicate similar tasks using low-cost alternatives to actuate the mechanisms or design a controller to accomplish desired tasks. To address this problem, we collected feedback from undergraduate mechanical engineering students enrolled in mechanical vibrations (junior level) and control theory courses (senior level) to assess their confidence levels and proficiency in programming, identifying areas where improvement is needed. We created a series of in-class and out-of-class learning activities designed in MATLAB Live editor for students taking mechanical vibrations and vibrations and control labs courses that incorporate programming. These activities are specifically designed to encourage and support students taking the mechanical vibrations course to serve as a candidate. Our continuous work involves iterative development and refinement of these activities based on ongoing feedback and assessment. Through these activities, we aim to bridge the programming gap and empower our students to excel in the increasingly technology-driven field of mechanical engineering.

Keywords

Mechanical vibrations; control theory; MATLAB Live Editor

Introduction

The transition into university, especially for incoming first-year students, has always been marked by a confluence of emotions, challenges, and newfound experiences¹. Many external and internal factors have complicated this journey recently, reshaping students' fundamental understanding and approach to their education. The profound influence of the COVID-19 pandemic, which introduced unprecedented disruptions, leading to isolation and limited access to traditional educational environments, cannot be overlooked². This isolation, while protective, inadvertently shifted the learning paradigm for many, challenging conventional pedagogy and student interaction, further widening the educational disparity among different student groups and dramatically altering the learning environment.

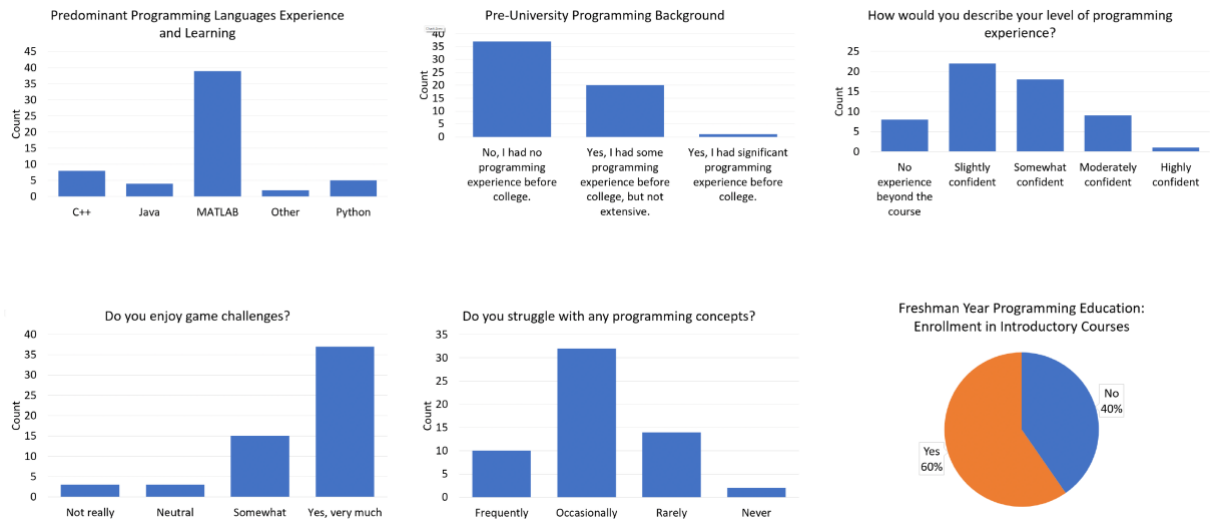

Figure 1. Fall 2023 Junior & Senior Survey Results

But even as the world grappled with the pandemic, another transformation was silently but steadily changing the educational landscape: the digital revolution³. In an era of ubiquitous internet access and the proliferation of smartphones, tablets, and other electronic devices, information has never been more accessible. While this surge in easy accessibility can be seen as a boon, facilitating instant knowledge acquisition also has drawbacks. The immediacy of information has often curtailed students' intrinsic drive to delve deep into subjects, grapple with challenges, or even commit to the rigorous problem-solving process. Rather than immersing themselves in the struggle to understand, many opt for the path of least resistance, sourcing ready-made answers without genuinely comprehending the underlying concepts. Furthermore, the swift growth of our educational frameworks demands interdisciplinary expertise, even from first-year students. For instance, a biology student today needs to comprehend computational thinking and programming to process extensive data sets for visualization. Similarly, modern mechanical engineering curricula often mandate programming to navigate intricate design computations. Such a dual-pronged challenge – nurturing the motivation to learn interdisciplinary skills and the temptations of readily available information – places students, especially those in mechanical engineering, in a precarious position as they commence their university journey.

An alarming manifestation of these shifts is evident in the diminished foundational knowledge many students possess as they enter higher education. A deficit in basic mathematical principles, a shortage of computational thinking, and underdeveloped problem-solving abilities contribute to a formidable uphill battle during their initial university years. During the Fall 2023 semester, a survey was conducted targeting mainly junior students from mechanical, mechatronics, and computer engineering programs—who had completed introductory programming courses in their freshman year—to evaluate their proficiency with programming and frequency of usage in other courses. While a significant number of participants were from the mechanical engineering program enrolled in vibrations and control theory courses, the survey included students from the mechatronics and computer engineering programs. The issue's core, as highlighted in Figure 1, is especially concerning for mechanical engineering: many first-year students are grappling with programming. Figure 1 depicts a survey that illustrates the wide range of programming experience

among incoming students, with a notable majority entering without prior knowledge. The figure further reveals a lack of experience in programming throughout the "university experience, continuing even upon graduation. It also points out that while students are getting exposure to MATLAB, they lack experience in other programming languages that are popular in the industry. However, the survey also shows that many students enjoy game challenges and problem-solving, suggesting an untapped opportunity to leverage these interests to foster a more engaging and effective programming education. This engagement could provide a critical medium for applying programming concepts to areas that students find enjoyable and relevant.

Literature Review

The realm of education has undergone profound transformations in recent years, significantly altering the learning landscape for students^{4,5,6}. Technological advancements and shifting pedagogical strategies have been at the forefront of these changes. This article delves into the evolving educational dynamics, with a particular focus on students' experiences in the digital era, the implications of these changes on their academic and professional trajectory, especially within the domain of Mechanical Engineering. In bygone eras, the educational journey was notably defined by a rigorous engagement with problem-solving tasks, primarily attributed to the scarcity of readily available solutions⁷. The endeavor to grapple with complex problems fostered a depth of understanding and a refined analytical prowess among learners. Fast forward to the present day, the advent of sophisticated digital tools like Generative Pre-Trained (GPT) AI models and a plethora of online resources have significantly eased the acquisition of solutions^{8,9,10,11}. This shift has served as a double-edged sword¹². On the one hand, motivated learners find themselves in a golden age of accelerated learning, with around-the-clock access to virtual tutors and a vast reservoir of knowledge, enabling them to delve deeply into their areas of interest^{13,14,15}. On the contrary, this ease of access may inadvertently nurture a shallow engagement with the learning material, especially among less motivated learners, potentially undermining the depth of understanding¹⁶. The COVID-19 pandemic further complicated the educational landscape, as many students found their academic pursuits sidelined by pressing concerns engendered by the global health crisis^{17,18,19,20,21,22,23}.

The evolving dynamics of the job market increasingly underscore the necessity for an interdisciplinary approach in academic and professional endeavors. This is particularly salient in mechanical engineering, where a strong foundation in programming has become indispensable²⁴. Recognizing these educational challenges has spurred a myriad of innovative solutions to enhance motivation and deepen the learning experience²⁵. These include engaging workshops and tutorials, gamification in programming courses, preparatory classes for those needing a stronger foundation, and a wealth of self-learning opportunities through online courses and tutorials on platforms like YouTube²⁶. A promising approach is the interactive integration of programming into coursework through live editor environments.

Learning Activities Developed in MATLAB Live Editor

Developing engaging learning materials is critical to active learning. However, faculty, especially those early in their careers, often face the challenge of dedicating sufficient time to course preparation, considering their heavy workload. Therefore, instructors highly appreciate open-source materials for classroom implementation. Mechanical Vibrations, a 3-credit engineering

course, and Vibrations and Control Laboratory, a 1-credit lab, are integral to the mechanical engineering program at Kennesaw State University. Both courses are deeply mathematical, and students frequently struggle to solve differential equations and visualize output motion. These courses also offer an excellent opportunity to enhance mechanical engineering students' programming skills. To address this, we are actively creating learning activities through homework and lab handouts using MATLAB Live Editor, which we share on our project website²⁷. With its interactive and intuitive interface, the MATLAB Live Editor plays a crucial role in enhancing the learning experience, especially in courses like mechanical vibrations and the vibrations and control Laboratory where one can incorporate programming, visualization, and documentation in a single environment. This integration allows students to see the impact of their code immediately, assisting in understanding complex mathematical concepts like differential equation solutions. The Live Editor's ability to display outputs, graphs, and equations alongside the code promotes a deeper comprehension of the material, making abstract concepts more tangible.

Moreover, the MATLAB Live Editor is a soft introduction to coding for mechanical engineering students, who are often new to programming. Its user-friendly interface, with features like syntax highlighting and automatic code formatting, reduces the initial intimidation factor associated with learning a new programming language. This environment encourages experimentation, where students can modify and execute code in real-time, seeing immediate results. This trial-and-error approach is instrumental in developing problem-solving skills and computational thinking, essential competencies in engineering education.

The implementation phase of our project revolved around two key courses: ENGR 3125 and ME 4501. We created in-class and out-off-class learning activities in the form of lab handouts in MATLAB Live Editor in ME 4501, and out-off-class activities as homework assignments in ENGR 3125 in which students were expected to upload their work in Live Editor format. All learning activities are shared publicly in our project's GitHub website²⁷. To ensure a foundational understanding of the required tools, both courses began with an ungraded homework assignment focused on completing MATLAB and Simulink Onramp interactive courses as more information can be found in [25]. An example learning activity in ENGR 3125, as shown in Figure 2, tasked students with designing a Grashoff double-crank four-bar mechanism, formulating vector-closure loop equations, solving them symbolically, plotting the results, and validating solutions through a virtual lab in MATLAB Simscape. This integrated approach aimed to reinforce theoretical concepts and empower students to apply their knowledge in simulated real-world scenarios.

Figure 3 displays the sections of a lab handout created in MATLAB Live Editor. This instructional document includes information on the deadline, task completion instructions, learning objectives, hands-on data recording procedures, theoretical modeling guidance, detailed calculations, and the use of MATLAB Simulink for model validation.

Previously, students were primarily accustomed to using MATLAB solely for data recording and plotting. However, with the transition to lab handouts created in MATLAB Live Editor, students initially faced challenges during the first three weeks, a period that could be characterized as a transitional phase. However, as the semester progressed, students gradually became more at ease with this new approach. Feedback obtained from course evaluations in the Spring 2023 semester reflected this evolution, with students expressing comments such as: *"I enjoyed learning how MATLAB can be used in control theory and vibrations and for writing very excellent and effective*

Position Analysis of a Four Bar Mechanism

A. Kinematic Analysis

1. Design a double crank mechanism.
2. Identify the link dimensions and the angles for the initial configuration using the sketch below. (The image only shows a four bar not necessarily a double crank.)

3. First, create a very similar table by using `table()` command and delete the below image after as it will no longer be needed in your report.

Mechanism Parameter	Dimensions
R_2	
R_3	
R_4	
R_1 (grounded link)	
$\theta_{20}, \theta_{30}, \theta_{40}$ initial angles	

Students create a table similar to the image

4. Write the vector closure loop equations. You will derive two equations for the vector sums; one for the horizontal component and one for the vertical component.

5. Identify the unknown parameters:

Unknown 1:

Students show their work as a syntax

Unknown 2:

6. Write a code below using `symbolic toolbox` and `solve` by rotating the crank angle, θ_2 , from its initial position to at least one complete solution. Plot θ_3 vs time, θ_4 vs time, θ_3 vs θ_2 and θ_4 vs θ_2 .

B. Virtual Lab Simulation and Validation

1. Download the virtual lab.
2. Open Mechanisms and Machines Virtual Lab.
3. Select Four Bar Linkages title and double click on the image.

Students validate theoretical solution using our virtual lab

Figure 2. Learning activity for machine dynamics and vibrations course (ENGR 3125)

lab reports./ I hated MATLAB so much but this course helped me understand how to use the program a lot more./ It was a bunch of fun experiments and we really got a chance to practice using our MATLAB skills./ I liked the individual MATLAB and Simulink labs during class./ How much I learned about MATLAB./ The application of MATLAB and how it was utilized in this course was very interesting./ This course features virtual labs created by research students, and the potential for others to contribute to the lab is fascinating./ It also helped reinforce our understanding of vibrations and MATLAB. / I enjoyed how Dr. Tekes pushed us to use MATLAB for writing lab reports. I feel much stronger in my MATLAB ability. / I enjoyed learning about MATLAB and the different ways it can be used like Simulink simulations."

ME 4501 - Vibrations and Control Laboratory
Lab 3: SDOF Rotational Vibrations
Instructor: Dr. Aime TEKES

Due: This is your second team lab and the deadline is two weeks after the lab.
One lab report per team should be submitted as *.m (Matlab file extension) in D2L under the Assignments folder before the deadline. [Show all the calculations in your report.](#)

CREATE YOUR REPORT IN A NEW FILE EDITOR AND INCLUDE THE FOLLOWING SECTIONS:

1. Team members: Please provide the name of the team members as well as who completed which section.
2. Introduction
3. Procedures
4. Theory
5. Calculations
6. Discussion
7. Answer to the problems in the last section.

Instructions

Learning Objectives

- To obtain the key properties of a one-degree-of-freedom (1-DOF) system undergoing **Rotational** vibrations using experimental analysis and theory
- To approximate the effect of inertia on a freely vibrating torsional system.
- Review calculating inertia of a composite structure using (a) point-mass approximation method, and (b) the parallel axis theorem.
- Understand the similarities and differences between torsional systems and translational systems undergoing vibrations.
- Find the damping of the system experimentally.
- Simulate the system in Matlab Simulink.

Equipment

The equipment required to successfully complete Lab 2 is shown in Figure 1 and listed below:

Figure 1. Equipment List
List the equipment used for the lab.

D. Free Vibration Data Collection from ECP Model 205 Data Collection

1. Collect free vibration data from System 1 by attach an accelerometer to the disk. Record the data along with the power spectrum.
2. Collect free vibration data from System 1 by attach an accelerometer to the disk. Record the data along with the power spectrum.
3. Share data with your group members.

E. Calculation of J_{L1}

1. Plot acceleration vs time graph of unloaded disk (System 1) and power spectrum of System 1.
2. Calculate the mass moment of inertia of unloaded disk (System 1) using the theory. Show your calculations below.

F. Calculation of J_{L2}

In this section of the lab, you will calculate the mass moment of inertia of the loaded disk (System 2) using:

- the experimental data,
- point-mass approximation,
- parallel axis theorem.

} Theoretical Calculations

1. As an additional resource, Watch Calculation of J_2 Video from D2L.
2. Download Calculation of J_2 notes from D2L.
3. Plot acc vs time graph and power spectrum data. **Write a code**
4. Calculate the experimental J_2 similar to J_1 using the natural frequency acquired from power spectrum. Show your calculations.
5. **Point Mass Approximation:** Referring to Calculation of J_2 notes and video, calculate the new mass moment of inertia for the loaded disk using point mass approximation. Show all your calculations.
6. **Parallel Axis Theorem:** Referring to Calculation of J_2 notes and video, calculate the new mass moment of inertia for the loaded disk using parallel axis theorem. Show all your calculations.

G. Calculation of Damping Ratio and Damping Constant of System 1 Write a code

In this section, please calculate the logarithmic decrement, damping ratio and damping constant of System 1. Please refer to the notes from lab 2 if necessary. Show all your calculations.

H. Matlab Simulink Model of SDOF Torsional System Create MATLAB Simulink Model for validation

1. Watch Matlab Simulink Model of Torsional System video from D2L.
2. Create your Matlab Simulink model following the instructions in the video.
3. Copy-paste your Simulink model, and compare the experimental data with the simulated response.]

Figure 3. Learning activity for vibrations and control laboratory course (ME 4501)

Conclusion

The integration of MATLAB Live Editor in the selected courses has shown promising results, particularly in improving students' understanding of mechanical vibrations and control theory. The Live Editor's interactive tools have positively impacted student engagement and their ability to program. Students showed resistance to MATLAB at the beginning of the semester, especially when writing lab reports in the Live Editor. However, over time, they became more comfortable with the programming and data analysis tasks required. Future surveying will be crucial in evaluating the long-term benefits of incorporating interactive tools like MATLAB Live Editor into coursework and lab activities. These surveys will provide insights into how such tools influence learning outcomes and student perceptions, guiding further curriculum enhancements. Expanding diverse programming tools and languages should also be explored, aligning to keep pace with the rapidly evolving technological demands in engineering education. The continuous assessment and adaptation of interactive learning methods are essential in preparing students for the complex challenges of their professional careers.
